Building a Green Home?

Whether you're building a green home, your dream home, or upgrading an existing home, Beam offers products to improve the home's **Indoor Environmental Quality (IEQ)**. IEQ is an important part of green building guidelines and requires the reduction of indoor air pollutants to qualify for certification. Both, Beam central vacuum systems and Beam HEPA air filtration systems, reduce pollutants and improve indoor air quality.

Your Beam Dealer can install a central vacuum system and HEPA air filtration system in just hours.

Central vacuum tubing installed through interior walls, attic, basement and crawlspaces connects vacuum inlets to the power unit/collection canister. Each strategically located inlet lets you vacuum approximately 700-800 square feet.

Beam Central Vacuum Features

- **Lifetime warranty** on power unit body and filter
- **Quiet Pak™ Sound Insulation System** makes Beam the quietest central vacuum available
- **High efficiency motor** delivers cleaning up to five times more powerful than upright models
- **Permanent self-cleaning HEPA filter** from the inventors of GORE-TEX® fabric

Cleaner, healthier living. Built in.

Improving Indoor Air Quality?

According to the EPA, indoor air is often up to five times more polluted than outside air. Your family deserves the cleanest, safest air. Beam's central vacuum systems are designed to remove 100% of contacted dirt, dust, debris, and animal dander from the home's living space. Beam is the only central vacuum system proven to relieve allergy symptoms by up to 61%. To find out more on the UC Davis study, visit beam.com.

Beam HEPA air filtration systems offer three levels of filtration to reduce indoor air pollution, a prefilter, the HEPA filter, and a carbon media filter. These filters capture **particulate**, **bioburden**, and **volatile organic compounds (VOCs)**, the three types of indoor air pollution.

Particulates include pollen, dust mites, pet dander, cigarette smoke & candle char

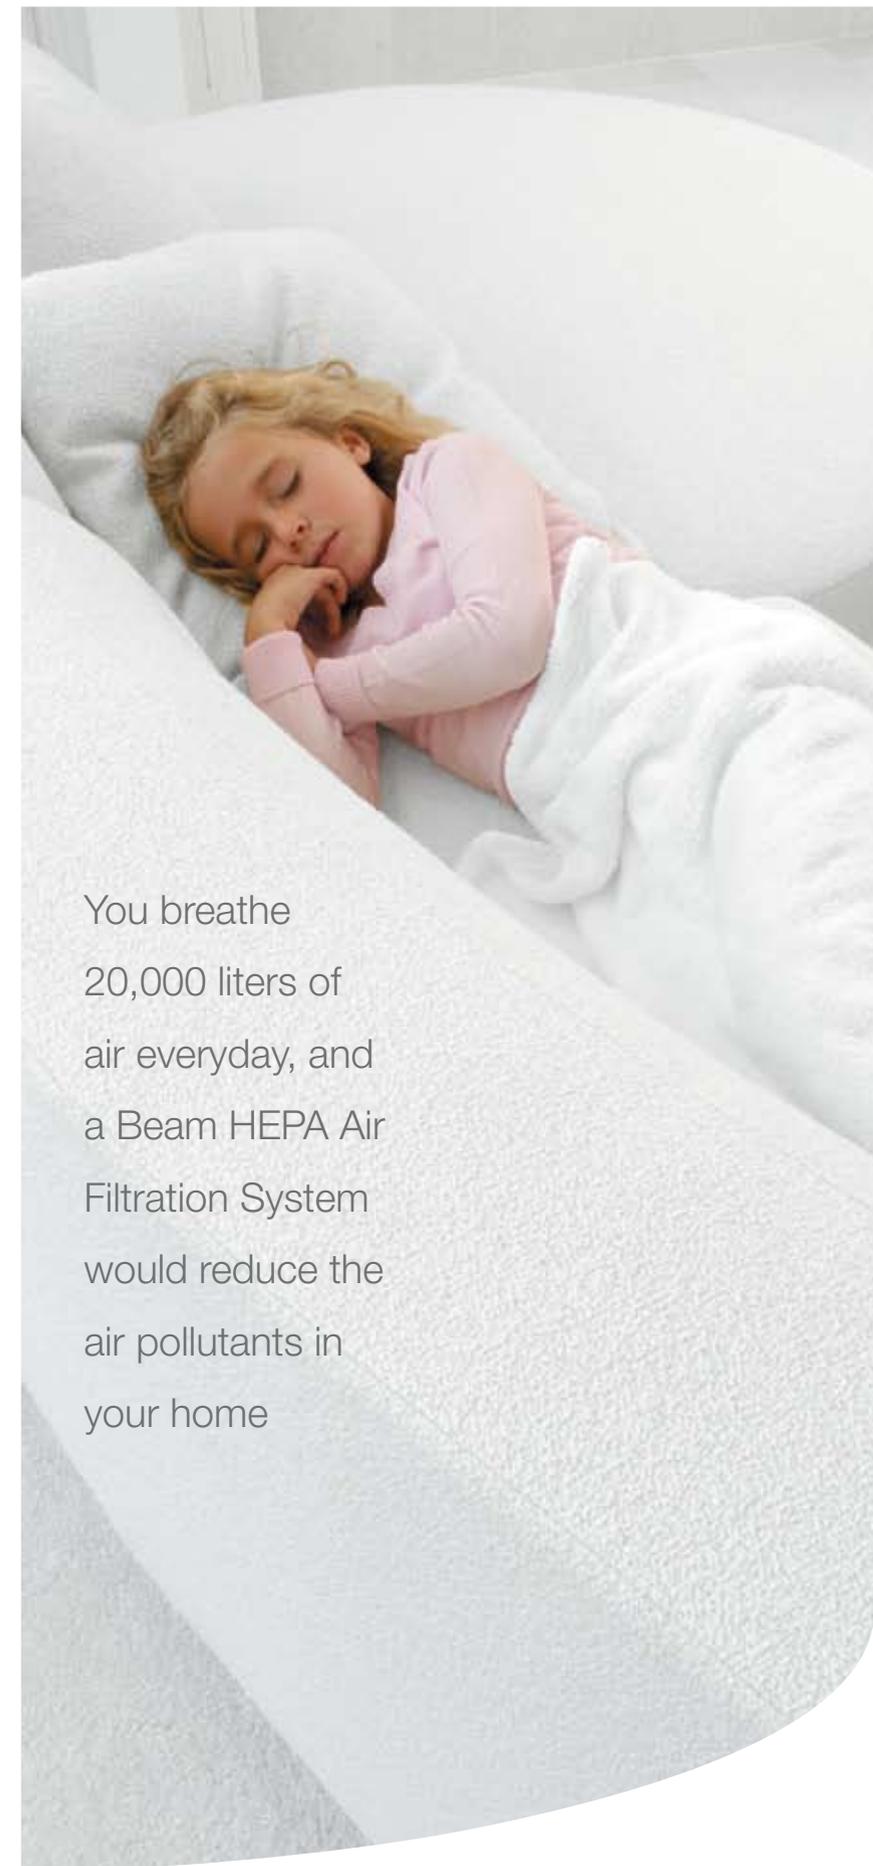

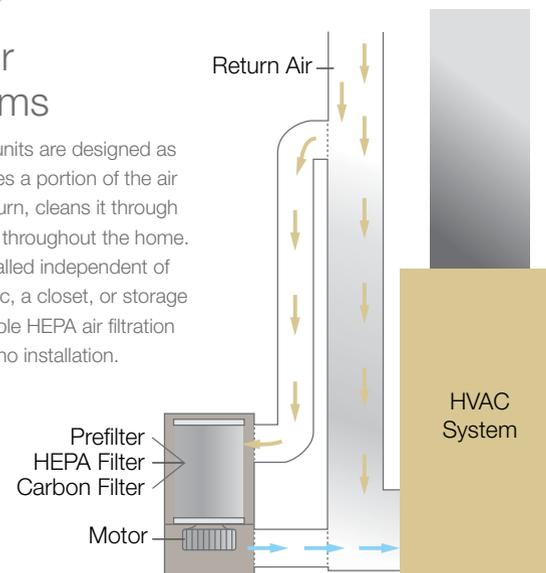

Bioburdens are bacteria, viruses, mold spores and fungi

VOCs, the gas state of chemicals, release from paints, perfumes, plastics, furniture & carpets and glue, to name only a few

Beam HEPA Air Filtration Systems

The Beam HEPA air filtration units are designed as a 'bypass' system, which takes a portion of the air from the furnace's cold air return, cleans it through the filter and then circulates it throughout the home. The systems can also be installed independent of the home's furnace, in the attic, a closet, or storage room. Beam also has a portable HEPA air filtration unit available, which requires no installation.

You breathe 20,000 liters of air everyday, and a Beam HEPA Air Filtration System would reduce the air pollutants in your home
